

# One-Page Summary: PromiseGrid Alignment Review

The PromiseGrid Dev Guide and Wire Lab are **substantially aligned with the direction emerging from CD Int/NINIK**. The review does not show a wholesale architectural reversal. CD Int mainly makes several concepts more precise and production-ready, which will eventually require targeted updates or clarification in both public projects.

## Biggest areas likely to require updates

| Update area                                                                  | Dev Guide impact            | Wire Lab impact             | Importance |
|------------------------------------------------------------------------------|-----------------------------|-----------------------------|------------|
| Agent identity separated from key/process/machine                            | Clarification needed        | Major clarification         | High       |
| pCID describes protocol semantics, not executable identity                   | Major conceptual refinement | Major conceptual refinement | Critical   |
| CID links do not inherently imply trust, ownership, retention, or dependency | Clarification needed        | Clarification needed        | High       |
| No single globally "latest" repository/component state                       | Clarification needed        | Mostly aligned              | High       |
| Storage, possession, availability, retention, and ownership are separate     | Major refinement            | Major refinement            | High       |
| Rebuildable views require explicit provenance/frontier                       | Major refinement            | Major refinement            | High       |
| External effects require readback and reconciliation                         | Major update                | Major update                | Critical   |
| Publishing a component does not automatically update a host                  | Major refinement            | Major refinement            | High       |
| Rollback means correction/restore activity, not erasing history              | Major refinement            | Mostly aligned              | High       |
| Capabilities remain locally granted and controlled                           | Clarification needed        | Major refinement            | High       |

## Most important overall finding

The biggest shift is toward **making evidence and boundaries explicit**. CD Int more clearly separates protocol meaning from executable implementation, CID knowledge from retained bytes, publication from local acceptance, and attempted external actions from proven external outcomes.

The external-effect pattern is especially important:

**intent/approval -> attempt -> response -> readback -> reconciliation -> correction if necessary**

This prevents an ambiguous timeout or receipt from being mistaken for proof that an outside system actually changed.

## What does not appear to need major rethinking

Core PromiseGrid ideas remain sound: local acceptance rather than global truth, agent-owned histories, sparse/CID-addressed evidence, rebuildable projections, independent timelines, local component adoption, and correction rather than rewriting history. Wire Lab POC18-POC21 is especially well aligned.

## Current recommendation

**Do not update either public project yet.** Use these reviews as a record of what may eventually flow back from CD Int. Several exact mechanisms remain unresolved, including AgentID details, repository/reference-set structure, authentication models, external-effect representation, availability guarantees, runtime adoption, and capabilities.
